Online Food Delivery System – Task Analysis & User Flow (Lucidchart)

Task Analysis

Task Analysis is the process of breaking down user interactions with a system into smaller, manageable steps to understand how users achieve their goals. It helps identify user needs, decision points, pain points, and areas for improvement.

In this project, we analyze how users interact with an **Online Food Delivery System** from browsing restaurants to placing an order.

Key Aspects of Task Analysis:

- Understanding what tasks users perform (e.g., searching food, placing order).
- Identifying the sequence of actions required to complete an order.
- Analyzing decision-making points (e.g., add more items? payment successful?).
- Recognizing possible errors (e.g., payment failure).
- Improving user experience by simplifying steps.

System Description: Online Food Delivery System

The Online Food Delivery System allows users to:

- Register / Login
- Browse restaurants
- Search for food items
- Add items to cart
- Apply promo codes
- Choose delivery time
- Make payment
- Track order

The system ensures a smooth and user-friendly ordering process.

User Flow

User Flow is a visual representation of how users navigate through an application to complete a specific task. It shows the steps users take from entry point to final action.

In this project, Lucidchart is used to create a flowchart representing the complete ordering process.

Key Aspects of User Flow:

- Represents decision-making paths (Yes/No conditions).
- Shows different navigation possibilities.
- Identifies loops (e.g., retry payment).
- Displays how users move between screens.
- Helps in improving UI design.

User Flow for Online Food Delivery System

Step-by-Step Flow:

1. **Start**
2. **Login/Register**
    - If new user → Register
    - If existing user → Login
3. **Browse Restaurants**
4. **Select Restaurant**
5. **View Menu**
6. **Add Item to Cart**
7. **Add More Items?**
    - Yes → Return to Menu
    - No → Proceed to Checkout
8. **Checkout**
9. **Enter Delivery Address**
10. **Select Delivery Time / Schedule**
11. **Apply Promo Code (Optional)**
12. **Select Payment Method (Card/UPI/COD/Wallet)**
13. **Payment Successful?**

- Yes → Place Order
- No → Retry or Change Payment Method

14. **Order Confirmation**
15. **Track Order**
16. **End**

Flowchart Symbols Used in Lucidchart

- **Oval** → Start / End
- **Rectangle** → Process (e.g., Add to Cart)
- **Diamond** → Decision (e.g., Add More Items?)
- **Arrow** → Flow Direction

Advantages of Using Lucidchart

- Easy drag-and-drop interface
- Professional flowchart templates
- Clear visualization of user journey

Conclusion

The Online Food Delivery System project demonstrates how task analysis and user flow diagrams help in understanding user interactions. Using Lucidchart, the entire process from login to order confirmation is clearly visualized.

This structured flow improves:

- User experience
- System efficiency
- Error handling
- Navigation clarity

Thus, Lucidchart is an effective tool for designing and analyzing UI workflows in real-world applications like online food delivery systems.
